REMARKS

U. S. Patent No. 5,949,296 describes a multi-power supply modular arrangement, the outputs of which are controlled by switching in correspondence with an input signal;

U. S. Patent No. 5,864,585 describes a digital communication system providing for a digital cosine segment demodulation of a sinusoidal carrier;

U. S. Patent No. 5,612,978 describes an adaptive frequency domain filter for short duration non-continuous waves employing fast Fourier transfer elements and the inverse thereof;

U. S. Patent No. 5,592,131 describes a system for modulating a carrier frequency wherein a sequencer produces a plurality of modulation signal portions separated by null modulation signal portions;

U. S. Patent No. 5,249,201 describes a system for transmitting multiple carrier signals to evolve an improved on/off ratio. To subtract off noise, an inverted signal is summed with a carrier;

U. S. Patent No. 5,193,222 describes a dual mode transmitter with two switching elements for electing mode types and interrupting and resuming outputs of a transmitted signal;

U. S. Patent No. 5,038,051 describes a switching modulator for a microwave radar transmitter with two switching devices;

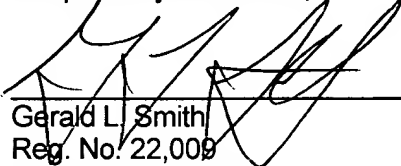

U. S. Patent No. 4,411,005 describes the application of data signals to an operational amplifier;

U. S. Patent No. 4,266,201 describes an improved pulse defining system for a pulse modulator; and

U. S. Patent No. 4,058,769 describes a carrier modulated in conjunction with a carrier power adjustment.

It respectfully is submitted that the foregoing documentation, taken alone or in combination, does not show nor suggest the present invention.

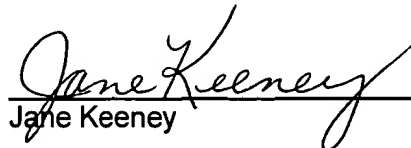

Respectfully submitted,

Gerald L. Smith
Reg. No. 22,009
MUELLER AND SMITH, L.P.A.
